

# MOCKUP 5 — Cross-Stage Tenant Fairness Plane

## Cross-stage scheduling targets the upper-right corner

Workload: equal-rate, continuously backlogged tenants; A uses 128 frames + short outputs, B uses 32 frames + long outputs. Both stages are overloaded; identical trace across policies and seeds.

Expected policy positions under simultaneous heterogeneous contention

Per-stage score for two tenants:  $F_s = 100 \left( 1 - \frac{|S_A^s - S_B^s|}{S_A^s + S_B^s} \right)$ . 100% means equal received service; 0% means one tenant received all service.

*Illustrative mockup—not measured results. Call this a fairness plane unless measurements establish a Pareto tradeoff.*
