

MOCKUP 6 — Identical-Cost Tenant Fairness Plane

Round-robin approaches max-min when every request has the same cost

Control workload: continuously backlogged A and B; deterministic A:B request rate = 2:1; identical 32-frame videos, prompts, and output limits.

Per-stage score: $F_s = 100 \left(1 - \frac{|S_A^s - S_B^s|}{S_A^s + S_B^s} \right)$. 100% means equal received service.

Illustrative mockup—not measured results. This control is not evidence of a CPU-GPU Pareto tradeoff.
